

Class presentations for Eukaryote labs.

The class presentation is an opportunity for your group to present its understanding and interpretation of the Eukaryote labs (wet and dry) and receive feedback from your colleagues and the teaching staff.

The intention is that preparing and delivering this orally will allow you to think about your results in a different way than you do for a written report. It is analogous to presenting your Masters project to your supervisors before submitting your written thesis and you should regard this as a learning exercise.

It might be helpful to present with the same basic structure as the written report, ie Intro, Aim and hypothesis, Materials and Methods, Results, Discussion.

Communication in science is extremely important, and your presentation skills will be assessed.

Present your understanding to the best of your ability, and we (as a group) will attempt to offer clarification and input if there is a need. If there are specific questions from your group, please feel free to raise these as a part of the presentation.

You should aim for 15→20 min, and there will be ca. 10 min discussion time where the rest of the class is expected to participate actively in discussion.
